

PanaList

“Build beautiful directories. Automate everything.”

Overview doc:

What

PanaList is a multi-tenant, Notion-inspired directory-site builder that lets anyone create beautiful, data-driven listings without technical skills.

Each tenant gets their own branded site — complete with categories, locations, listings, blog, and analytics — all managed from a single, intuitive dashboard.

With built-in automation from the Brave API and GPT-5, users can populate, refine, and publish content that looks and reads like it was crafted by a professional.

How

Under the hood, PanaList blends a simple CMS with advanced automation. The Brave API powers smart content ingestion, pulling real-world data, contacts, and descriptions for instant directory creation.

GPT-5 then enhances and formats this content, while the integrated blog engine performs keyword research, drafts SEO-ready articles, and automatically schedules posts to LinkedIn and X.

Every site runs on a modern, multi-tenant Go + React stack — lightweight, secure, and scalable — making PanaList effortless to manage, whether for one site or one thousand.

Why

Most people who need a directory — from local business groups to niche communities and industry hubs — don't have time or technical expertise to build one.

PanaList removes the complexity. It turns what used to be a multi-month project into an afternoon setup, giving users powerful automation and creative control in equal measure.

By combining smart AI, live theming, and built-in growth tools, PanaList empowers anyone to launch, manage, and monetise a professional-grade directory without touching a line of code.
